### QUELQUES PARTICULARITÉS CLINIQUES ET SÉROLOGIQUES DE LA GRIPPE EN 1957-58 CHEZ DES ENFANTS

Par FRANÇOIS V. M. IDASOV  
Directeur de l'École de la Grippe  
Dr V. V. RIHOVA  
Chef de Laboratoire de Pratique et d'Étude de la Grippe  
Institut de Médecine, Moscou, U.R.S.S.

Résumé

Les auteurs ont étudié 177 cas de grippe A. A. 37 isolés au cours de la même pandémie de grippe. Ils ont noté une série de différences cliniques. Ces virus provoquent un tableau clinique très différent, mais convergent en ce qui concerne la production de l'antigène de la nucléocapside et l'absence de manifestation clinique au cours de la phase primaire. La période d'incubation est de 1 à 3 jours. La période de latence est de 1 à 2 semaines. La propagation de virus dans les zones extratropicales se fait par voie humaine. La surveillance de virus dans le monde est assurée par les services de prévention de virus dans le monde. Les virus A. 37 ont été trouvés dans les zones extratropicales, par exemple en France, en Italie et en Espagne. Les virus A. 37 ont été trouvés chez les adultes et provoquent le tableau clinique que l'on observe chez les enfants et provoquent le tableau clinique que l'on observe chez les adultes.

La récente pandémie de grippe a attiré l'attention non seulement sur les particularités biologiques qu'elle a eues (Harrison, 1958), mais aussi sur les aspects épidémiologiques qui distinguent le virus A. A. 37 de ceux qui ont provoqué les épidémies précédentes (Mayer et al. 1957). On sait que la primo-infection grippe détermine chez les enfants d'âge préscolaire des manifestations cliniques, pathogénomiques et immunologiques particulières (Rosen 1958). Il nous a paru intéressant d'étudier ces manifestations au cours de la pandémie 1957-58.

### RESULTS OF FURTHER RESEARCH ON INFLUENZA IN THE USSR

With Special Reference to the 1957 Pandemic

V. M. ZHDANOV

Deputy Director of Health  
Director, W.H.O. Influenza Centre for the USSR  
Academy of Medical Sciences, Moscow, USSR

This article presents the main results of the research carried out between 1954 and 1957 by the Influenza Department of the Institute of Virology, Academy of Medical Sciences, USSR. The research has been concentrated on the influenza virus among adults and preschool children, studies of immunization, epidemiology, and therapeutic and prophylactic methods in combating the propagation and use of live vaccines and sera. Particularly intensive research was conducted during the pandemic of Asian influenza in 1957 and the findings of properties of A2 virus strains, the clinical course of the illness in infants and adults, the spread of the pandemic in the USSR and certain results of influenza control measures are among the subjects discussed.

This article is a short review of the basic results of research carried out during the period 1954-57 in the Influenza Department and in certain other laboratories of the Ivanovskii Institute of Virology of the USSR Academy of Medical Sciences.

During this period the Department of Epidemiology (Director, G. V. Baranov) and the Viral Infections Clinic (Director, N. V. Sergeev) have become independent subdivisions of the Institute as a result of which the Influenza Department of which the present writer is Director now consists of three laboratories: the Influenza Diagnostic Laboratory (Director, A. S. Gorbunov), the Laboratory for Specific Prophylaxis against Influenza (Director, V. V. Biron) and the Laboratory for Acute Respiratory Catarrhs under the direct control of the Director of the Department.

In addition to the Influenza Department, whose work is co-ordinated with other laboratories in the Institute and which is the base for the USSR Regional Influenza Centre, many other laboratories in the Institute and the Viral Infections Clinic are also working on influenza.

TITLE: Classification and nomenclature of influenza viruses

SOURCE: Voprosy virusologii, no. 4, 1966, 498-504

TOPIC TAGS: influenza, influenza virus, biologic classification, taxonomy, *virus,*

*virology*

ABSTRACT:

A special committee formed for the development of a unique classification and nomenclature of viruses has offered a plan in which the grouping and division of viruses is based on determination of the chemical composition and detailed anatomical structure of the viruses. The following table presents the general principles of classification:  
The article also includes data concerning the antigenic relationship of the characteristic strains of influenza virus and an exemplary chart for the classification of these viruses. It

TITLE: Infectious hepatitis, Botkin's disease

SOURCE: AMN SSSR. Vestnik, no. 8, 1966, 87-92

TOPIC TAGS: ~~infectious~~ hepatitis, Botkins disease, epidemiology, public health, DISEASE CONTROL

ABSTRACT:

Various aspects of Botkin's disease, a type of infectious hepatitis, are analysed. Its principal victims are children and young adults. The disease is one of the most widespread viral infections in the Soviet Union, and is more dangerous for children than for adults. Clinical aspects and a detailed plan for its prophylaxis are presented. [WA-50; CBE No. 11]
